The steam-electric power station is a power station in which the electric generator is steam driven. Water is heated, turns into steam and spins a steam turbine which drives an electrical generator. After it passes through the turbine, the steam is condensed in a condenser. The greatest variation in the design of steam-electric power plants is due to the different fuel sources.

Bear Trap Inverted Bucket Steam Traps. For efficient condensate drainage of industrial process and HVAC equipment. Inverted bucket traps rely on the density difference between steam and water to drain condensate as it forms.

A thermal power station is a power station in which heat energy is converted to electric power. In most of the places in the world the turbine is steam-driven. Water is heated, turns into steam and spins a steam turbine which drives an electrical generator. After it passes through the turbine, the steam is condensed in a condenser and recycled to where it was heated; this is known as a Rankine cycle.

The potential opportunities for improving energy efficiency and lower CO₂ emissions in raw material generation and production of concrete are smaller than in cement manufacturing. For instance, CO₂ emissions during transport could be reduced by replacing diesel fuel with biodiesel. Normally, energy efficiency improvements proportionally reduce the emissions of CO₂ generated from fossil fuel ...
